

2026 Annual Report

葛 建

Letter to Family Members

Compounding through volatility.

Dear family members, The football formation set out in the FY2025 report remains my operating map: defense, midfield, and attack. The job is to survive ordinary markets, control the direction of play, and strike hard when the market gives us a rare opening.

Defense is cash and short-duration safe assets. Cash is the back line. It does not score, but it keeps the team alive. In normal or euphoric markets, defense preserves capital. In panic, it supplies capital to the attack.

Midfield is core U.S. technology and AI. NVDA, AVGO, MSFT, TSM, MAGS, and Nasdaq-related exposure control the tempo. They express the long-term view that American technology, AI, cloud, semiconductors, software, and platform businesses remain our best compounding engine. NVDA can defend and create; AVGO connects infrastructure, networking, custom silicon, and enterprise demand.

Attack is TQQQ OTM LEAPS calls. This is the striker. It does not need to touch the ball in every market. When panic, forced selling, VIX spikes, and discounted long-dated calls create the right opening, the attack becomes decisive. Its job is to convert rare dislocations into nonlinear returns.

Our approach is simple, though not easy. Charlie Munger's rule was plain: *"repeat what works."* The first law of our U.S. equity playbook is this: inside a normal bull-market regime, near-vertical selloffs are *almost inevitably* followed by near-vertical recoveries. I am a left-side buyer. I build into weakness, lower the average cost as options cheapen, and accept that the bottom tick will not be obvious.

Exit discipline is mechanical. I do not scale out merely to feel prudent. If the attack reaches its predefined return multiple on average cost, I sell the entire position. If it does not, I re-underwrite the thesis, downside, and opportunity cost.

At the current reporting cut, total assets are **CNH 4,616,249.33**, equal to **15.39%** of the **CNH 30,000,000** retirement objective. The number matters, but the formation matters more: defense preserves survival, midfield carries conviction, and attack delivers convexity. We wait for fear, buy convexity in panic, and monetize it when optimism returns.

Account overview

This page shows the historical asset value progression of systems K, X, and P, with each year presented as a consolidated system-level view.

Financial Projection Through 2039

The core story is not a single-year gain; it is the transition from linear accumulation to a capital base that can compound through volatility. This page gives the long-range projection its own visual weight.

Capital Flows

Historical capital flows show the transition from cash-driven accumulation to a more investment-led growth profile. FY2026 adds **CNH 1,566,120.62** of net contribution and return impact.

Cumulative Contribution Mix Through FY2026

This page decomposes the cumulative sources of current assets, not FY2026-only inflows. Investments represent accumulated investment gains and account for **47.0%**; Mengyu represents cash provided by my father at **36.3%**; Kertin represents my own cash contributions at **11.7%**; Rent & Gifts represent rental income and gift money at **5.0%**.

Real estate in China

China property assessment. The chart’s decisive signal is that net additions to China’s personal mortgage balances stopped expanding from 2022 onward. Residential property is therefore no longer the dominant household leverage channel or macro credit accelerator; policy easing can stabilize the downside, but the sector should be viewed as balance-sheet repair rather than a renewed property-led growth engine.

Commodities, bond yields & FX

FY2026 values are held as placeholders until year-end. The completed row should update USOIL, US10Y, DXY, USD/CNH, and USD/JPY before the report is treated as final.

Year-end prices					
Y	USOIL	US10Y	DXY	USD/CNH	USD/JPY

Macro-Financial Review: TQQQ, VIX, US10Y, and USD/CNH (FY2026)

These FY2026 market charts track the operating variables behind the portfolio framework: TQQQ for high-convexity Nasdaq exposure, VIX for stress-driven deployment windows, US10Y for duration pressure, and USD/CNH for currency translation risk.

Asset Selection and Classification Framework

Screening logic. Group A is the core universe of dominant companies with structural growth; Group B is the high-convexity toolkit of leveraged ETFs; Group C is the emerging growth watchlist where uncertainty is higher but payoff asymmetry can be meaningful. The tables provide evidence for classification, not a mandate to own every name.

Group A: Dominant Companies with Strong Structural Growth¹

Key dates

Operating rule. Market stress is treated as a deployment condition: when VIX rises above 30 or Nasdaq drawdowns reach crisis levels, forward exposure through TQQQ, SOXL, and selected LEAPS becomes eligible for activation.

Date	Event	Notes
29 Jun 2007	iPhone launch	Start of the mobile internet cycle
25 Nov 2008	First Fed QE phase	Shift in global monetary regime
3 Jan 2009	Bitcoin created	Emergence of a new monetary paradigm
6 Mar 2009	Post-GFC capitulation	Trough of the post-2008 cycle
23 Mar 2020	Fed unlimited QE	Trough of the pandemic shock
13 Oct 2022	Inflation capitulation (US CPI)	Trough of the monetary tightening cycle
30 Nov 2022	ChatGPT launched	Start of the AI cycle
23 Oct 2023	US 10Y yield peak (5 %)	End of the rate-shock episode
7 Apr 2025	Global tariff shock	Trough of the geopolitical and trade cycle

Period	Duration (days)	Event	SPX drawdown
24 Mar 2000 - 10 Oct 2002	931	Dot-com bust & 9/11 attacks	-50 %
11 Oct 2007 - 6 Mar 2009	512	Housing bubble & global financial crisis	-57 %
21 Sep 2018 - 26 Dec 2018	96	Trade war & Fed rate-hike fears	-20 %
19 Feb 2020 - 23 Mar 2020	33	Covid-19 lockdowns	-34 %
04 Jan 2022 - 13 Oct 2022	282	Inflation & Fed rate-hike fears	-26 %

VIX history

VIX history turns isolated crisis dates into a repeatable playbook. The important observation is not that volatility spikes, but that the most attractive entries often appear when volatility is visibly uncomfortable.

Year	Low	High	Date of high	Notes (date of high)	Days VIX > 30	Days VIX > 40	Days VIX > 50
2008	15.82	96.40	Oct 23, 2008	Global financial crisis (GFC)	84	67	52
2009	16.26	57.36	Jan 20, 2009	Recession fears	122	66	17
2010	15.23	48.20	May 21, 2010	Eurozone crisis	31	6	0
2011	14.27	48.00	Aug 8, 2011	US credit-rating downgrade	80	21	0
2012	13.30	27.73	Jun 4, 2012	Fears around Spanish banks	0	0	0
2013	11.05	21.91	/	/	0	0	0
2014	10.28	31.06	Oct 15, 2014	Fear of QE ending	1	0	0
